

Dungeon Escape is a 2D maze game built on Java. The player controls an explorer in a cursed dungeon. The goal is to collect all the gems and reach the exit while avoiding moving monsters and static traps. The dungeon is structured as a maze with walls and barriers, one start point and one exit. The player wins by collecting all of the gems and reaching the exit safely. The player loses if they are caught by a monster or if their score falls below 0 after falling into a trap.

- Monsters use a semi-random chase algorithm: they pursue the player but occasionally take random turns, making their behavior less predictable.

- Bonus chests appear randomly for a few seconds and give large score boosts or power-ups like player speed boosts.

- Different difficulties: harder levels increase monster speed and reduce bonus duration.

- Gems are worth 10 score points
- Chests are worth 50 score points, + 50% speed boost
- Traps deduct 20 score points
- Monsters end the game immediately
